Effective Information Sharing Platforms for Boosting Cybersecurity:
Towards the Regulation of Trust in Cyberspace

Abstract

The rapidly-increasing cyber risks to governments and organizations require a variety of regulatory models and tools to provide effective responses. One of these measures is information sharing (IS), which involves a trust-building among competitors in the priivate sector as well as reliance on government regulators. In several countries IS platforms have been established that balance cybersecurity priorities with the safeguarding of individual privacy and intellectual property. This presentation will review the successes and vulnerabilities of IS platforms, and current trends.
